

Entertain

Getting started

The big picture

Entertain helps you organize the meals you host at home: build a menu from your own dishes and drinks, and the app works out the shopping, grouped by supplier.

Three reusable catalogs sit at the core — your **ingredients**, your **dishes**, and your **drinks** — grouped under the **Catalog** tab. Then come the **events**: for each one you build a menu and the app turns it into a supplier-grouped shopping list. Build the catalogs once, reuse them for every event.

First time, step by step

1. Set things up in Settings

Set your greeting and signature (they top and tail the order messages). Open Suppliers and name the shops you use — a category (butcher, fishmonger...) can hold several suppliers, with one marked default.

2. Add ingredients and drinks

In the Catalog tab: add ingredients (each with a default unit and supplier) and drinks (each with a supplier and a denomination — bottle, can, jug...).

3. Create dishes

A dish is either **cooked at home** (you add ingredients with quantities) or **bought ready-made** (you pick a supplier and the servings one unit provides). Cooked dishes drive the shopping list from their ingredients; bought dishes are a single purchase line.

4. Create an event

Give it a type, a format (seated or buffet), a date, and the number of guests — format and guests are what the app uses to scale quantities.

5. Build the menu

Add dishes (cooked or bought) and, in the drinks section, drinks. A dish added to an event becomes its own copy you can fine-tune. Servings scale with the format (seated → guests; buffet → catalog value); drinks don't scale — you set the number of units. A well-balanced menu tends to land around 3–5 servings per guest (food only; drinks aren't counted).

6. Shop by supplier

In the event's Shopping tab everything is grouped by supplier — ingredients, prepared dishes, and drinks. Pick the supplier when a category has more than one, and the app drafts the order message with your greeting and signature.
