

Entertain

A short guide for testers

Thanks for taking the time to try Entertain. It's an app for organizing the meals and gatherings you host at home - the kind of planning that usually lives in scattered notes, group chats, and last-minute supermarket runs. The idea is to keep all of it in one calm place: you build a menu from your own dishes, the app works out the ingredients, and it hands you back a shopping list already sorted by the supplier you'll buy each thing from.

The big picture

There are two reusable catalogs - your **ingredients** and your **dishes** - that you build up over time. Then there are **events**: a lunch, a dinner, a gathering. For each event you compose a menu from your dishes, and the app turns that into a shopping list grouped by supplier. Build the catalogs once, reuse them for every event.

First time, step by step

If this is your first time opening the app, here's the smoothest way to get going. Follow it in order the first time; after that, you'll jump around however you like.

1. Set things up in Settings

Open the Settings tab first. Set your **greeting and signature** - these are used at the top and bottom of the order messages the app drafts for your suppliers, so they read like something you actually wrote. Then look at **Suppliers**: you'll see the built-in categories (butcher, fishmonger, greengrocer, supermarket, pantry). Give the ones you use a name and a contact, so orders can go straight to the right place.

Tip: while you're here, the General section has a Getting Started card and your account details. Every main screen also has a small help icon next to its title if you get stuck.

2. Add a few ingredients

Go to the Ingredients tab and add the things you cook with. For each one you set a **default unit** (grams, units, a bottle...) and a **default supplier** (which shop it comes from). Those two defaults are what let the app build a tidy shopping list later. You don't have to add everything at once - just enough to build your first dish.

3. Create a dish or two

In the Dishes tab, create a dish and add its ingredients with quantities, plus a base number of servings (how many people the recipe is written for). If you realize an ingredient is missing, you can add it to the catalog right there without leaving the dish - both ways work.

4. Create your first event

Go to the Events tab and add an event. Give it a type (lunch, dinner), a format (seated, buffet), a date, and the number of guests. That guest count is important: it's what the app uses to scale your dish quantities to the size of the gathering.

5. Build the event's menu

Open your event and go to its Menu tab. Add dishes from your catalog. Here's the one thing really worth remembering: a dish added to an event becomes **its own copy**. Adjust its ingredients or quantities for this particular occasion and your original catalog dish stays exactly as it was. The Menu tab keeps a

running total - dishes, servings, and servings per guest - so you can see at a glance whether you've planned enough food.

6. Shop by supplier

Switch to the event's Shopping tab. Every ingredient from your menu is gathered here and grouped by supplier. Each item has a status you can tap through - to order, ordered, received, already at home - and each supplier header shows the running tally without having to open it. When you're ready, the app drafts the order message for you, using the greeting and signature you set in step 1. You can also add a few **extra** items to a supplier's order - things you want to buy that aren't part of the event.

A few more things

Events, dishes, and ingredients can each carry a few photos; the first one becomes the cover everywhere it appears. The app follows your phone's language - Catalan, Spanish, or English. And if you ever want your data removed, your account ID is in Settings, under Privacy & data.

What helps us most

Use it for something real if you can - plan an actual meal and walk the whole flow. The feedback we value most isn't about big crashes; it's the small moments where something felt confusing, slower than it should be, or just not where you expected it. Those are hard for us to see from the inside and easy for you to spot. Tell us about them - and thanks again for the help.
